

2 Statements (Questions):

The govt. should build more dams and canals to improve access to irrigation for farmers

The best use of land anywhere in Pakistan is for agriculture

Which statement do you agree with more? Give examples and places you have studied to support your answer

I agree that using Pakistan's land for agriculture is the best idea, since Pakistan is an agricultural country and most of its exports comprises of Agro based products. Agriculture provides employment to more than half of the population living in Pakistan. So if government could provide easy loans through ADBP, source of mechanization through programs like Green Revolution and introduction of new researches through Agricultural Research Development Councils; then Pakistan could promote its exports also.

However, building large dams has its own limitations; as Large – Scale Irrigation Project requires heavy investments. Many dams in Pakistan like Tarbela on Indus and Mangla on Jhelum are facing the problem of siltation and many dams in Pakistan like Warsak are built on seasonal rivers like Kabul River thus are not functioning as per the expectations.

Therefore, agriculture being the prime profession of Pakistan can bring overall development in Pakistan if new and modern methods and techniques are being introduced to it.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

The govt. should spend more money on development projects in the less densely populated province in Pakistan. The province is behind in development.

The govt. should spend more money on development projects in the more densely populated provinces in Pakistan. More people live there.

Which statement do you agree with more? Give examples and places you have studied to support your answer.

(CIE Examinations – May / June 2015)

I agree that developing projects in less densely populated province is the best idea, since province like Balochistan which is less densely populated province, has wider developmental prospectus. The presences of large mineral resources like Gold & Copper at RiqoDiq and Natural Gas at Sui; can provide a large unrestricted space for such projects. Moreover, the presence of port's facilities may lead to free industrial zones which can play its part in improving the overall economy of the country.

However, introducing development projects in densely populated provinces like Sindh, Punjab and KPK has its own limitations as it will not only increase transportation problems like in Karachi and Lahore; but will also lead to population congestion; thus putting more pressure on the agricultural lands to meet the food requirements.

Therefore, less densely populated area like Balochistan must be given a chance to match the evenly developmental process to share the economical constraints; countries like Pakistan face.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

There are advantages and disadvantages to Pakistan of trading with different countries or group of countries. Read the following two views:

Pakistan would benefit from stronger trade links with China.

There are more advantages to Pakistan in maintaining trade with EU (European Union) countries.

Which statement do you agree with more? Give examples and places you have studied to support your answer.

(CIE Examinations – May / June 2015)

I agree that getting trade benefit from China is the best idea, since China has a faster growing economy so Pakistan can earn more benefits along with more foreign exchange. Moreover, it will also reduce dependency on Western Countries for Pakistan, which will not only reduce the western imports but can help to minimize the negative trade balance. China on the other hand can also help Pakistan by manufacturing cheap product to meet the local demand curtailing the import expenses spent on luxury items.

However, trade links with EU has its own limitations; as most of the EU countries have trade barriers with the countries outside EU. This may restrict trade relations with Pakistan due to poor law and order situation in the country. Furthermore, many small / cottage industry products might lack International Quality Standard and may face un-acceptance due to political instability and child labour.

Therefore, trade links with China can be proved worthy; yet, Pakistan can trade with EU on smaller scales in order to meet the market trends set by EU.

Read the following two views about over population in Pakistan:

The problems caused by overpopulation can only be solved by increasing resources such as food, housing and essential services.

The needs of the people can only be met if population growth can be controlled.

Which view do you agree with more? Give reasons to support your answer and refer to examples and places you have studied.

(CIE Examinations – May / June 2016)

I agree that increasing resources to reduce the problems of overpopulation is the best idea, since Pakistan has large tendency to practice agriculture. So, if many of the desert areas like Thal in Punjab and Thar in Sindh could be reclaimed by providing irrigation facilities will not only reduce the food shortage but will also increase the export of Pakistan. Since most of the population lives in rural areas in Pakistan therefore, by introducing green revolution methods in agriculture would increase the total crop yield. Moreover, systematic measure needs to be introduced as a govt. scheme to provide electricity through Rural Electrification Programs along with facilities of sanitation and improved building schemes to reduce the overpopulation problems.

However, controlling population speed has its own limitations; as most of the people living in rural areas have a tradition to have larger families as a symbol of pride. Moreover, limiting birth rate is also considered as a negative religious belief and hence Family Planning Programmes like Green Star are not so welcomed by the rural population.

Therefore, Pakistan must focus upon providing basic facilities to its population so that they could have a better lifestyle since, controlling birth rate / population might be a long term task.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

Read the following two views about water shortages in Pakistan:

The best way to prevent water shortages in Pakistan is to build more dams and other infrastructure projects. These will store or supply more water.

The best way to prevent water shortages in Pakistan is to educate people about different methods of saving water. These methods could be carried out in agriculture, industries and in homes.

Which view do you agree with more? Give reasons to support your answer and refer to examples and places you have studied. You should consider both View A and View B in your answer.

(CIE Examinations – May / June 2017)

I agree that building more dams to store or supply water is the best idea, since Pakistan has one of the largest river, Indus which is fed by its eastern & western tributaries. At present only 3 large multipurpose dams are available. Therefore, by constructing more reservoirs; Pakistan will not only be able to prevent water loss flowing downstream into the sea but will also be able to store more water. Pakistan has many ideal dam's constructing sites like Kalabagh etc. which will not only provide water to the irrigation channels but will also help Pakistan to be self sufficient in power generation through HEP.

However, conserving water through domestic policies and awareness has its own limitations; as most of the people living in urban areas are associated with Industries; which requires water as the main raw material. Moreover, with the growing population; the need of water has increased a lot which can't be resisted through general awareness among the population. Planting trees and lining canals will definitely conserve the water but most of these methods are time consuming, and in a country like Pakistan where people are not easily approachable for awareness programs, the conservation of water needs to be practices on a large scale.

Therefore, Pakistan must focus upon constructing mega projects to be self sufficient in water resources.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

Read the following two views about increasing food supplies in Pakistan:

Development of livestock is the best way to increase the amount of food available in Pakistan.

Increasing crop production and cultivable area is the best way of ensuring there is enough food in Pakistan.

Which view do you agree with more? Give reasons to support your answer and refer to examples and places you have studied.

(CIE Examinations – May / June 2017)

I agree that development of livestock to increase food production is the best idea, since Pakistan has large multi – national farms which have the tendency to produce protein rich food for the population. Moreover, in many parts of Pakistan like Multan & Sahiwal many breeds of cattle and buffaloes like Nili, Kundi are available which provide a rich source of milk, ghee and meat. Furthermore, since many sure – footed animals can even survive in rugged terrains like Swat and Dir etc. therefore, livestock farming can even be promoted through govt. support as many of these areas are rich in Shamilats.

However, increasing crop production as a food source has its own limitations; since many cultivable lands in Pakistan are over – exhausted due to continuous farming. Multi – cropping and over – cropping methods have already led to saturation point for the soil. Furthermore, irrigation network in Pakistan had also caused seepage which led to Water logging and Salinity; due to which many areas in Pakistan had turned out to be barren.

Therefore, Pakistan must focus upon developing livestock farming as a rich protein food source which will not only fulfils the demands of the local people but its bi – products like leather and bones etc. will also give boost to different industries in Pakistan. This may also generate employment and has the potential to increase the foreign exchange.

(GUIDE TO SOLVE ‘D’ TYPE QUESTIONS)

Read the following two views about reducing the population growth rate in Pakistan:

The population growth rate is best reduced by family planning programmes.

The population growth rate is best reduced by increasing literacy for all, especially females.

Which view do you agree with more? Give examples and places you have studied to support your answer.

(CIE Examinations – May / June 2015)

I agree that increasing literacy among the females is the best idea, since education is a direct approach and has more effects than just on population. A literate woman will not only provide a helping hand in increasing the economical standards but will also provide a platform for a controlled birth rate in the longer terms by educating their children. Furthermore, literacy will also provide a career orientation which may result in having fewer children for a better future of their families.

However, introducing family planning programs has its own limitations; as most of the religious factors are against reduction in family size like One Child Policy (in China). Furthermore, programs like Behbud Association and Green Star Clinics have not yet achieved their desired goals in Pakistan since the use of contraceptives and other birth controlled medicine proved to have severe side effects.

Therefore, literacy among the females might reduce the ever growing population in Pakistan and once the females are educated they will automatically be literate enough to know about the family planning programs.

Read the following two views about solution to Pakistan's shortage of energy:

To produce more energy large scale power generation schemes such as nuclear, gas – fired, oil – fired & multipurpose HEP (Hydel) power stations should be built.

To produce more energy small scale power generation schemes should be set up such as bio gas, wind and solar power plants.

Which view do you agree with more? Give examples and places you have studied to support your answer.

(CIE Examinations – May / June 2015)

I agree that producing power through small scale schemes is the best idea, since Pakistan lies in a sub – tropical climate zone and 250 – 300 days in most of the areas like, Multan, Faisalabad etc. are sunny; therefore, there is a wide scope for producing power through solar power plants. Moreover, like Ghara Wind Project many coastal areas like Sonmiani, Ormara have the potential to generate a large amount of power. Since most of these renewable methods are excluded with the terminology of depletion, Pakistan can have a cheap source of electricity. Furthermore, since bio – mass is easily available on large scale & being a cheap source of energy Pakistan can develop its power production with the aid of countries like China etc.

However, generating power through large scale scheme has its own limitations; as being Non – Renewable energy resources; Pakistan can't rely on them due to their depletion rate. Moreover, constructing a nuclear power plant is a costly investment which also requires the regulation of water. Since, coal and oil are not easily available in Pakistan; the govt. can't take the burden import expenses. Moreover, there is always a threat of leakage of waste like in Nuclear Power Plant which may be great danger for the eco system.

Therefore, constructing small scale projects will not only put fewer burdens on the economy of Pakistan but will also help it to conserve more energy with less investment.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

Read the following two views about reducing the high unemployment rate in Pakistan:

Unemployment levels are best reduced by increasing training opportunities in agriculture and other primary sector jobs.

Unemployment is more likely to be reduced by providing education in skills for manufacturing & service industries.

Which view do you agree with more? Give examples and places you have studied to support your answer.

(CIE Examinations – May / June 2016)

I agree that reducing unemployment through primary sector is the best idea, since Pakistan has an agrarian economy and has the potential to employ large work force especially in agriculture and mining industries. Moreover, many mineral sites like Mansehra in KPK and Panjgore in Balochistan are still unexplored / unexploited which may require labour force leading towards curtailing unemployment. Furthermore, people can be engaged in trainings and workshops for repairing agriculture and mining machineries.

However, reducing unemployment through service industries has its own limitations; as manual work in service industries is limited. With the induction of computers and mechanization, manual work has been reduced, hence; the sector won't be able to cater the unemployment rate. Moreover, due to tough competition in global market; skilled and professional employees are required which may not fits in the criteria for unemployment population.

Therefore, unemployment can best be reduced through primary industries; however, if a grand stance to educate and provide training to the people is initiated by the govt. then it would lead towards decrease in unemployment rate in even service sector.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

Read the following two views about possibilities for industrial development in Pakistan:

It is better for Pakistan to promote large scale industries which provide more goods for domestic use and for other industries.

It is better for Pakistan to promote small scale and cottage industries in rural areas.

Which view do you agree with more? Give examples and places you have studied to support your answer.

(CIE Examinations – May / June 2016)

I agree that promoting small / cottage industries in rural areas is the best idea, since these industries may provide an important source of income in the rural areas. Moreover, the money will be re – invested locally and will definitely increase employment opportunities. These developments will not only curtail rural – urban migration but will also increase the export in Pakistan. Since small / cottage industries like some in Swat, Quetta etc require low investment therefore these industries can also be utilized to recycle the wastes from cotton and steel industries etc.

However, promoting large scale industries has its own limitations; as a very high capital investment is required to set a formal industry like Steel or Textile industries. Furthermore, the import of expensive raw material is also a burden on the economy; which usually goes in vain due to change in govt. policies and political instability. Moreover, large scale industries are also the major reason for deforestation in order to be installed and in return the industrial waste which is produced may increase the environmental pollution in the country.

Therefore, developing small / cottage industries will not only increase the GDP of the country but if developed properly can fulfil the local demands of the country.

(GUIDE TO SOLVE ‘D’ TYPE QUESTIONS)

1 statement (To what extent Questions)

To what extent do you think farmers should be trained to build small scale irrigation projects and use the existing supplies of water more efficiently?

Give examples and places to support your answer

Using the existing supplies of water efficiently in Pakistan is possible as Pakistan has the largest irrigation networks in the world. Farmers in Pakistan can be trained through Agricultural Research Development Council to meet their irrigation needs through developing small scale irrigation projects even in those areas where water is scarce. Like, Karez System in Balochistan and Tank Irrigation methods in Punjab. These irrigation methods are not only cheaper to develop but will also fulfil the irrigation requirements.

However, small scale irrigation projects have their own limitations. The network of canals may lead to problems like Water logging and Salinity which is a menace to agriculture. Moreover, the water table in Pakistan is gradually decreasing with the increase in population and can affects the residential and industrial setups in the country.

Hence, if small irrigation networks are monitored and controlled carefully only then it would be considered as a development in the Irrigation Network of Pakistan.

To what extent is it possible to increase water supply in Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2013)

Increasing the water supplies in Pakistan is possible as Pakistan has some of the largest glaciers and rivers system. The Indus River itself has a greater discharge especially in the months of June and July when most of the glaciers feed it along with its tributaries, like Jhelum and Chenab etc. Moreover, the Arabian Sea present towards the south of Pakistan can be utilized for desalination.

However, conserving water in Pakistan has its own limitations as due to hot climatic areas along the Indus plains witness high evapo – transpiration rate which results in low water table. Moreover, the reservoirs in Pakistan like Tarbela on Indus and Mangla on Jhelum are less efficient due to the problem of siltation. Due to which most of the river water is uselessly flown towards the sea. The ever increasing population in Pakistan is also a major reason for less conservation of water.

Hence, if public awareness program can be conducted for less usage and more storage of water; only then Pakistan can increase its water supplies efficiently.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent Industrial Development is possible in Pakistan?

Support your answer by giving examples you have studied.

Industrial development is possible to a great extent in Pakistan since it is an agrarian country and has the potential to set agro – based industries to a greater extent which will not only provide more job employment opportunities but will also help to reduce the Imports burden on Pakistan. Pakistan has a great potential to export its product throughout the country and there are many places which have been developed for the same. Special Industrial Zones (SIZ) are already set in order to increase the manufactured goods to be utilized within Pakistan; even though they are located in backward areas. Moreover, Industrial Zones of Pakistan has already been functioning to provide the industrial sector a helping hand to increase their exports in accordance with Free Trading Zones and Trade Development Authority of Pakistan (TDAP).

However, there are some limitations as Pakistan is a brand oriented nation which increases the demand of import goods. In order to reduce this burden the Industrialization sector in Pakistan has to really work hard to meet the international standard by increasing the quality of their products. Moreover, the products exported by Pakistan are either processed or semi – processed which needs to be upgraded to manufactured product so that more foreign exchange could be earned.

Hence if, the govt. of Pakistan pays more interest towards industrialization of the country it should provide a subsidy in taxes to the industrialist so that foreign investors could be attracted. This will not only provide an opportunity for a shift towards industrialization but will also make the living standards better.

(GUIDE TO SOLVE ‘D’ TYPE QUESTIONS)

To what extent is it possible to save and even increase the area of forest in Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – Oct / Nov 2014)

Saving and increasing the forest cover in Pakistan is possible as Pakistan has some forest cover like Coniferous towards Northern areas, Chitral, Dir etc. Riveraine along the Indus banks and Sub – Tropical Dry forests towards Punjab, Multan, Gujrat & Jhelum etc. but in order to conserve and increase the forest cover; the Govt. of Pakistan must enforce laws and rules on illegal timber cutting and different NGOs like AKRSP must play their active role towards Afforestation and Reforestation projects.

However, conserving and increasing forest cover in Pakistan has its own limitations as the demand of timber and wood has been increasing due to continuous urbanization in the country. Being an agricultural country, the government of Pakistan always shows lack of interest towards land clearings for agricultural purposes. Moreover, due to mismanagement in the forestry department and lack of capital; many projects for Afforestation and Reforestation like plantation of mangroves along the coast have not produced the required target.

Hence, if public awareness program can be conducted for the importance of forest cover by the Govt. along with initiation of Replanting strategies on large scale only then Pakistan would be able to increase its current forest cover.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent could the improvement of rail, road and air transport may improve the distribution of food supplies in Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2013)

Development of rail, road and air transportation is possible in Pakistan; as introduction of modern transportation network like Motorways, new and upgraded domestic airports and services like Orange / Metro trains will definitely provide a quick service for the distribution of food supplies. The air transport will hence be able to transport perishable products to different cities whereas railways can be best used for bulky goods. Furthermore, an updated network of roads will not only provide door to door service but will also link food growing areas to their markets in a more convenient way.

However, development of transportation has its own limitations as due to poor infrastructure facilities and lack of govt. funding; many of the developmental projects are still in pipeline. The slow pace of developmental projects have not just increase the congestion of transportation services but also created a negative impact upon the minds of local people. Furthermore, the repair and maintenance cost of transportation services may also increase the burden on the economy of Pakistan.

Hence, if development of transportation is carried out with lesser time of completion with no extra burden on the economy then it will be the best source of distribution for food supplies in Pakistan.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent better education and training could increase farm production?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2014)

Increasing farm production in Pakistan through education and training is possible as agriculture potential is greater. Yet, the production depends upon better education of farming techniques and human inputs like high production seeds and processed fertilizers. The farmers in Pakistan must utilize mechanization in their farming to boost up the agricultural process. For a better production many organizations like Plant Protection Department and Agricultural Development Research Council have to play their effective role.

However, providing education and training to farmers in Pakistan has its own limitations as many farmers have small land holdings due to which application of mechanization is limited. The hold of landlords restricts many farmers to introduce new techniques in their farms. Moreover, the climatic changes and old traditional irrigation methods like tank irrigation and wells are also some of the limitations to increase farm production.

Hence if, new and easy to approach agricultural education and training centres are introduced by the govt. only then, Pakistan can enjoy the maximum required farm yield being an agricultural country.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent can Pakistan rely on fossil fuels to increase fuel and power supplies?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2014)

Increasing energy supplies through fossil fuels in Pakistan is possible as Pakistan has large reservoirs of Oil, Gas and Coal at Sui, Mari, Parkoh, Potowar Plateaus and Thar etc. The sea ports present at Karachi like Port Qasim has already been a refining centre for Crude Oil. Whereas, coal being a cheap fuel source can easily be converted into electricity like in Thar Coal field. The IPI Gas pipeline projects have also provided new doors to the smooth supply of Natural gas in Pakistan.

However, using fossil fuels in Pakistan has its own limitation as they are considered as Non – Renewable Energy resources and if completely relied then may deplete at a faster rate. Moreover, fossil fuel like crude oil is very expensive to import and countries like Pakistan cannot afford it. Furthermore, transportation and leakage problems are also a hindrance to the smooth supply of fossil fuels.

Hence if, the cost of production including the exploration and extraction expenses can be curtailed down then Pakistan has all the potential to overcome its energy crisis.

(GUIDE TO SOLVE ‘D’ TYPE QUESTIONS)

To what extent could a better road network increase development of small and craft industries of Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2014)

Development of small and craft industries is possible in Pakistan by upgrading the road network as more remote areas will be connected. Better and easy to access roads will not only provide a faster and safer route but will also provide an easy access to raw materials and markets.

However, providing road network towards mountainous areas has its own limitations due to continuous threats of land sliding and avalanches. Moreover, the people living in remote areas have less marketing skills which may not provide them the opportunity to earn more through their craft works and once the road network is made better; it will allow the influence of imported cheap manufactured goods, which will definitely increase the competition.

Hence if, better access to training is provided to crafts men in Pakistan, then it would not only help maintaining better GDP but will also increase their economies by selling souvenirs to the tourist.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent can agriculture be sustainable in Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2014)

Practicing sustainable agriculture in Pakistan is possible as many areas in Pakistan don't practice over cropping / multi cropping methods. Yet, sustainability can only be achieved if proper guidance and training is provided to the farmers in Pakistan regarding better soil management techniques and restricting the use of heavy machineries. Chemical farming is obsolete in most of the western countries and organic farming is practiced. The same needs to be implemented in order to have a sustainable agriculture in Pakistan.

However, applying sustainable methods of agriculture has its own limitations as there is always a high demand of more food and the farmers are reluctant to adopt new changes. Uncooperative land lords and lack of govt. support may also restrict the implementation of sustainable farming. Moreover, high prices of GM seeds and processed organic fertilizers provide a resistance to approach sustainability in Pakistan.

Hence if, better irrigation techniques are introduced along with introduction of land reforms and contour ploughing methods; only then sustainable agriculture can be achieved in Pakistan.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

It has been proposed that a new motorway should be built in Sindh from Hyderabad via Thatta to Keti Bander on the Indus Delta, a town with a population not more than 25000. Explain why this motorway might be needed? To what extent would this proposal be possible?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2015)

Constructing Motorway from Hyderabad via Thatta to Keti Bander is possible as it will open a new route towards seaport and will definitely help reducing the pressure on Karachi Port. It can also help to transport industrial goods and raw materials in a better and faster way. Furthermore, with the presence of Indus Highway, the motorway will be a less investment project that will not only initiate the industrial development but can also serve as a transit route via Karachi Port to different cities of Sindh.

However, constructing the said motorway has its own limitations as Keti Bandar is a Deltaic area which is rich in mangroves. Therefore, constructing a motorway might lead to deforestation of mangroves. Furthermore, the presence of swamps will make this project a bit difficult to be constructed and prone to floods. .

Hence if, the said motorway can only be economical if a high foreign funding or interest is at stake since, the population density of the area is quite low too.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent can the development of renewable energy resources improve the reliability of electricity supply in Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2013)

Development of renewable energy resources in Pakistan is possible, as there are many sites to produce renewable energy resources as a cheap source of power generation. Many places in Pakistan like coastal areas; Makran Coast has the potential to generate power through wind and solar energies. One such wind project is still working at Gharo, Sindh. Moreover, to the north; Himalayas have even the potential to generate electricity through Geo – Thermal Power Plant.

However, developing renewable energy resources has its own limitations as most of these renewable energy production ways are very costly to install and repair. Moreover, the energy produced by these resources is of low quantity and cannot be relied upon due to sudden change in climatic conditions. Lack of technology and skills is another factor which hinders the development in this section.

Hence if, better technology and skill is provided to Pakistan; it may result in extensive conservation of electricity in Pakistan.

(GUIDE TO SOLVE ‘D’ TYPE QUESTIONS)

The United Nation has predicted that the population of Pakistan may double from 2010 to 2050.

To what extent can Pakistan increase its food supplies for this large population?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2013)

Increasing the food supplies in Pakistan is possible, as there are many rivers present like Jhelum, Chenab etc which could increase the irrigation network in Pakistan. Moreover, organizations like Plant Protection Department (PPD), Agricultural Research & Development Council (ARDC) has worked efficiently to provide nitrogenous fertilizers and HYV seeds to the farmers of Pakistan. Better transportation system introduced to the Agro – based industries has not only increase the GDP but also results in better storage of and distribution of food source throughout the country.

However, increasing food supplies has its own limitations; as the induction of chemical methods has not only reduced the fertility of the soil but the import's burden has also increased. Many areas of Pakistan which are still practicing the subsistence methods of farming are resilient towards adopting new researches in the field of Agriculture. Lack of capital investment and land ownerships have increased the pressure on the lands of Pakistan.

Hence if, sustainable farming methods are introduced in the agricultural department along with the consent and support of the Government only then Pakistan would be able to increase its food production to meet the demand of its population.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

To what extent is it possible for marine fishing to be developed sustainably in Pakistan?

Support your answer by giving examples you have studied.

(CIE Examinations – May / June 2016)

Practicing Sustainable marine fishing is possible in Pakistan, as many laws have been introduced by the Marine Fisheries like issuing quota license etc. Furthermore, if the fishermen in Pakistan can be restricted to fish in the banned months like January, June & July it will definitely be helpful for the breeding of fisher. Sustainability can also be achieved if we could secure the fishing grounds from International Catch along with adopting measures to reduce over fishing in Arabian Sea.

However, sustainable marine fishing has its own limitations as; the govt. of Pakistan doesn't have enough resources and capital which could enhance the sustainability. Moreover, the deforestation of mangroves has also reduced the fish population in our seas. Since many of the marine fishermen are subsistence fishermen therefore, lack of skills and awareness is a major factor for un-sustainability in Pakistan.

Hence if, better methods could be adopted to reduce pollution from seas and laws / fines are implemented upon it then marine sustainability could be achieved in Pakistan.

(GUIDE TO SOLVE 'D' TYPE QUESTIONS)

It has been proposed that a large integrated iron and steel mill should be built on the outskirts of Rawalpindi, Punjab.

80 km² of the land will be cleared for the mill and new infrastructure will be provided to the site by the local authorities. Large amount of raw material will be brought onto the site by road or rail and it is planned to produce up to 3 million tonnes of finished steel per year.

Evaluate how the new integrated iron and steel mill will affect the local people of Rawalpindi.

Give reasons to support your answer. You should consider BOTH benefits and problems in your answer.

(CIE Examinations – May / June 2017)

Construction of new iron & steel industry is possible in Rawalpindi, as it will not only generate employment opportunities but will also allow new settlement along the suburbs. Recreational facilities and improvement of transportation network will add a benefit to the local people of Rawalpindi. Moreover, since the raw material required for the Steel and Iron industry is widely present near Kalabagh therefore, the construction of Steel and iron industry will open doors for the trade along with initiation of many new related industries. Hence, more revenue will be generated which will make Rawalpindi more developed.

However, construction of a large scale industry like iron & steel near Rawalpindi has its own limitations as; the induction of industrial development will not only attract migrants but will also lead to congestion of population along with congestion in transportation. Air pollution will also be major problem for the city. Since Rawalpindi caters Headquarters of Armed Forces; and many delegates are visiting the vicinity; the construction of a large scale industry might give a sore look to the natural beautification.

Hence if, industrial development in Rawalpindi can be attained by reducing deforestation and natural beauty; this industry will also be a great boon for Pakistan Armed Forces in the manufacturing of weapons etc.

Evaluate whether using global telecommunication has improved employment opportunities in Pakistan.

Give reasons to support your answer and refer to examples you have studied. You should consider different point of views in your answer.

(CIE Examinations – May / June 2017)

Using global telecommunication to improve employment opportunities is possible in Pakistan, as it will not only boost the tertiary sector but will also improve the working conditions in Pakistan. Furthermore, with the induction of data transport, video conferencing, e – mail and instant messaging the transmission media have also expanded from traditional copper wires to microwaves, terrestrial wireless, satellites and broadband fiber transportation giving boost to the employment opportunities in Pakistan.

However, development of global telecommunication has its own limitations as; poor electricity, outdated infrastructure facilities and load shedding problems have had hampered its true essence. Moreover, due to low literacy level in Pakistan many people find themselves incompetent enough which led towards fewer employment opportunities.

Hence if, global telecommunication has to be developed in Pakistan, the Govt. must initiate technology based workshops and training programs for the public to make them aware of the benefits of global telecommunication.

(GUIDE TO SOLVE ‘D’ TYPE QUESTIONS)
